Name of Title : ParkNFly – Smart Airport Parking Made Easy

1. Abstract:

ParkNFly – Smart Airport Parking Made Easy is a web-based application that has been developed to offer a smooth and efficient experience to reserve a parking spot for airport traveller's. Passengers may prefer traveling to airports in personal cars, and reserving taking a secure and convenient parking space may prove difficult at the airports, especially during peak travel times. This project presents an online solution to search and reserve parking spaces, cutting down on delays and unneeded hassle. The platform is designed to provide a usable interface so that customers can quickly and conveniently complete the booking procedure on any device.

The system provides functionalities such as searching for a parking spot based on travel date, time, terminal location, vehicle type, and parking time. Then it shows the price corresponding to each offer so that the user can compare and make a choice. After choosing the most suitable spot, it is required to input vehicular details and follow through the mock payment procedure. Upon booking confirmation, a digital barcode/QR code is generated which can be used for hassle-free entry and exit. They also have a booking history, and they can change or cancel their bookings if they want to.

Besides, the admin module helps parking authorities manage slot availability, price updates, customer bookings, and occupancy reports. Frontend project development is done using HTML5, CSS3, JavaScript, and React.js, with Node.js and Express.js as backend services. REST APIs are implemented for data communication, and MySQL or LocalStorage are used for storage purposes. Overall, ParkNFly not only enables more convenience, and the saving of valuable time but also stands as a proof of the use of full-stack web technologies in solving real-world airport transportation problems to improve customer satisfaction and operational efficiency.
